Data Mining Classification: Alternative Techniques

Bayesian Classifiers

Introduction to Data, Mining, 2nd Edition by Tan, Steinbach, Karpatne, Kumar

1

Bayes Classifier

- A probabilistic framework for solving classification problems
- Conditional Probability: $P(Y | X) = \frac{P(X,Y)}{P(X)}$

$$P(X \mid Y) = \frac{P(X,Y)}{P(Y)}$$

Bayes theorem:

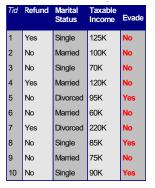

$$P(Y \mid X) = \frac{P(X \mid Y)P(Y)}{P(X)}$$

2/08/2021

Introduction to Data Mining, 2nd Edition

Using Bayes Theorem for Classification

- Consider each attribute and class label as random variables
- Given a record with attributes (X₁, X₂,..., X_d), the goal is to predict class Y
 - Specifically, we want to find the value of Y that maximizes P(Y| X₁, X₂,..., X_d)
- Can we estimate P(Y| X₁, X₂,..., X_d) directly from data?

2/08/2021

Introduction to Data Mining, 2nd Edition

3

3

Using Bayes Theorem for Classification

- Approach:
 - compute posterior probability P(Y | X₁, X₂, ..., X_d) using the Bayes theorem

$$P(Y \mid X_{1}X_{2} ... X_{n}) = \frac{P(X_{1}X_{2} ... X_{d} \mid Y)P(Y)}{P(X_{1}X_{2} ... X_{d})}$$

- Maximum a-posteriori: Choose Y that maximizes
 P(Y | X₁, X₂, ..., X_d)
- Equivalent to choosing value of Y that maximizes
 P(X₁, X₂, ..., X_d|Y) P(Y)
- How to estimate $P(X_1, X_2, ..., X_d | Y)$?

2/08/2021

Introduction to Data Mining, 2nd Edition

Example Data

Given a Test Record:

$$X = (Refund = No, Divorced, Income = 120K)$$

lid Refund		Status	Income	Evade	
1	Yes	Single	125K	No	
2	No	Married	100K	No	
3	No	Single	70K	No	
4	Yes	Married	120K	No	
5	No	Divorced	95K	Yes	
6	No	Married	60K	No	
7	Yes	Divorced	220K	No	
8	No	Single	85K	Yes	
9	No	Married	75K	No	
10	No	Single	90K	Yes	

We need to estimate
 P(Evade = Yes | X) and P(Evade = No | X)

In the following we will replace

Evade = Yes by Yes, and

Evade = No by No

2/08/2021

Introduction to Data Mining, 2nd Edition

5

5

Example Data

Given a Test Record:

$$X = (Refund = No, Divorced, Income = 120K)$$

	Tid	Refund	Marital Status	Taxable Income	Evade
ı	1	Yes	Single	125K	No
	2	No	Married	100K	No
	3	No	Single	70K	No
	4	Yes	Married	120K	No
	5	No	Divorced	95K	Yes
	6	No	Married	60K	No
	7	Yes	Divorced	220K	No
	8	No	Single	85K	Yes
	9	No	Married	75K	No
	10	No	Single	90K	Yes

Using Bayes Theorem:

$$P(Yes \mid X) = \frac{P(X \mid Yes)P(Yes)}{P(X)}$$

$$\square P(No \mid X) = \frac{P(X \mid No)P(No)}{P(X)}$$

□ How to estimate P(X | Yes) and P(X | No)?

2/08/2021

Introduction to Data Mining, 2nd Edition

Conditional Independence

- X and Y are conditionally independent given Z if P(X|YZ) = P(X|Z)
- · Example: Arm length and reading skills
 - Young child has shorter arm length and limited reading skills, compared to adults
 - If age is fixed, no apparent relationship between arm length and reading skills
 - Arm length and reading skills are conditionally independent given age

2/08/2021

Introduction to Data Mining, 2nd Edition

7

7

Naïve Bayes Classifier

- Assume independence among attributes X_i when class is given:
 - $P(X_1, X_2, ..., X_d | Y_j) = P(X_1 | Y_j) P(X_2 | Y_j)... P(X_d | Y_j)$
 - Now we can estimate P(X_i| Y_j) for all X_i and Y_j combinations from the training data
 - New point is classified to Y_j if $P(Y_j) \prod P(X_i|Y_j)$ is maximal.

2/08/2021

Introduction to Data Mining, 2nd Edition

Naïve Bayes on Example Data

Given a Test Record:

X = (Refund = No, Divorced, Income = 120K)

Tid	Refund	Marital Status	Taxable Income	Evade
1	Yes	Single	125K	No
2	No	Married	100K	No
3	No	Single	70K	No
4	Yes	Married	120K	No
5	No	Divorced	95K	Yes
6	No	Married	60K	No
7	Yes	Divorced	220K	No
8	No	Single	85K	Yes
9	No	Married	75K	No
10	No	Single	90K	Yes

P(X | Yes) =

P(Refund = No | Yes) x

P(Divorced | Yes) x

P(Income = 120K | Yes)

P(X | No) =

P(Refund = No | No) x

P(Divorced | No) x

P(Income = 120K | No)

2/08/2021

Introduction to Data Mining, 2nd Edition

9

g

Estimate Probabilities from Data

P(Yes) = 3/10

- e.g., P(No) = 7/10,

P(y) = fraction of instances of class y

Refund Marital Taxable Evade Status Income Yes Single 125K No 2 No Married 100K No 3 No Single 70K No Yes No Married 120K 5 Divorced 95K No Yes No Married 60K No Yes Divorced 220K No 8 85K No Single Yes 9 No Married 75K No 10 No Single 90K Yes

For categorical attributes:

$$P(X_i = c| y) = n_c/n$$

- where |X_i =c| is number of instances having attribute value X_i =c and belonging to class y
- Examples:

P(Status=Married|No) = 4/7 P(Refund=Yes|Yes)=0

2/08/2021

Introduction to Data Mining, 2nd Edition

Estimate Probabilities from Data

- For continuous attributes:
 - Discretization: Partition the range into bins:
 - Replace continuous value with bin value
 - Attribute changed from continuous to ordinal
 - Probability density estimation:
 - Assume attribute follows a normal distribution
 - Use data to estimate parameters of distribution (e.g., mean and standard deviation)
 - Once probability distribution is known, use it to estimate the conditional probability P(X_i|Y)

2/08/2021

Introduction to Data Mining, 2nd Edition

11

11

Estimate Probabilities from Data

Tid	Refund	Marital Status	Taxable Income	Evade
1	Yes	Single	125K	No
2	No	Married	100K	No
3	No	Single	70K	No
4	Yes	Married	120K	No
5	No	Divorced	95K	Yes
6	No	Married	60K	No
7	Yes	Divorced	220K	No
8	No	Single	85K	Yes
9	No	Married	75K	No
10	No	Single	90K	Yes

Normal distribution:

$$P(X_i | Y_j) = \frac{1}{\sqrt{2\pi\sigma_{ij}^2}} e^{\frac{(X_i - \mu_{ij})^2}{2\sigma_{ij}^2}}$$

- One for each (X_i,Y_i) pair
- For (Income, Class=No):
 - If Class=No
 - ◆ sample mean = 110
 - sample variance = 2975

$$P(Income = 120 \mid No) = \frac{1}{\sqrt{2\pi}(54.54)}e^{\frac{(120-110)^2}{2(2975)}} = 0.0072$$

2/08/2021

Introduction to Data Mining, 2nd Edition

Example of Naïve Bayes Classifier

Given a Test Record:

X = (Refund = No, Divorced, Income = 120K)

Naïve Bayes Classifier:

 $P(Refund = Yes \mid No) = 3/7 \\ P(Refund = No \mid No) = 4/7 \\ P(Refund = Yes \mid Yes) = 0 \\ P(Refund = No \mid Yes) = 1$

P(Marital Status = Single | No) = 2/7 P(Marital Status = Divorced | No) = 1/7 P(Marital Status = Married | No) = 4/7 P(Marital Status = Single | Yes) = 2/3 P(Marital Status = Divorced | Yes) = 1/3

P(Marital Status = Married | Yes) = 0

For Taxable Income:
If class = No: sample mean = 110
sample variance = 2975
If class = Yes: sample mean = 90
sample variance = 25

Since P(X|No)P(No) > P(X|Yes)P(Yes)Therefore P(No|X) > P(Yes|X)=> Class = No

2/08/2021

Introduction to Data Mining, 2nd Edition

13

13

Naïve Bayes Classifier can make decisions with partial information about attributes in the test record

Even in absence of information about any attributes, we can use Apriori Probabilities of Class

P(Yes) = 3/10P(No) = 7/10

Naïve Bayes Classifier: P(Refund = Yes | No) = 3/7

P(Refund = No | No) = 4/7
P(Refund = Yes | Yes) = 0
P(Refund = No | Yes) = 1
P(Marital Status = Single | No) = 2/7
P(Marital Status = Divorced | No) = 1/7
P(Marital Status = Married | No) = 4/7
P(Marital Status = Single | Yes) = 2/3
P(Marital Status = Divorced | Yes) = 1/3

For Taxable Income: If class = No: sample mean = 110 sample variance = 2975 If class = Yes: sample mean = 90

sample variance = 25

P(Marital Status = Married | Yes) = 0

If we only know that marital status is Divorced, then:

P(Yes | Divorced) = $1/3 \times 3/10 / P(Divorced)$ P(No | Divorced) = $1/7 \times 7/10 / P(Divorced)$

If we also know that Refund = No, then

P(Yes | Refund = No, Divorced) = 1 x 1/3 x 3/10 /
P(Divorced, Refund = No, Divorced) = 4/7 x 1/7 x 7/10 /

P(No | Refund = No, Divorced) = 4/7 x 1/7 x 7/10 / P(Divorced, Refund = No)

If we also know that Taxable Income = 120, then

P(Yes | Refund = No, Divorced, Income = 120) = $1.2 \times 10^{-9} \times 1 \times 1/3 \times 3/10 /$ P(Divorced, Refund = No, Income = 120)

P(No | Refund = No, Divorced Income = 120) = 0.0072 x 4/7 x 1/7 x 7/10 / P(Divorced, Refund = No, Income = 120)

2/08/2021

Introduction to Data Mining, 2nd Edition

Issues with Naïve Bayes Classifier

Given a Test Record:

X = (Married)

Naïve Bayes Classifier:

$$\begin{split} &P(\text{Refund} = \text{Yes} \mid \text{No}) = 3/7 \\ &P(\text{Refund} = \text{No} \mid \text{No}) = 4/7 \\ &P(\text{Refund} = \text{Yes} \mid \text{Yes}) = 0 \\ &P(\text{Refund} = \text{No} \mid \text{Yes}) = 1 \end{split}$$

P(Marital Status = Single | No) = 2/7 P(Marital Status = Divorced | No) = 1/7 P(Marital Status = Married | No) = 4/7 P(Marital Status = Single | Yes) = 2/3 P(Marital Status = Divorced | Yes) = 1/3

P(Marital Status = Divorced | Yes) = 1 P(Marital Status = Married | Yes) = 0

For Taxable Income:

If class = No: sample mean = 110 sample variance = 2975 If class = Yes: sample mean = 90 sample variance = 25 P(Yes) = 3/10

P(No) = 7/10

 $P(Yes \mid Married) = 0 \times 3/10 / P(Married)$ $P(No \mid Married) = 4/7 \times 7/10 / P(Married)$

2/08/2021

Introduction to Data Mining, 2nd Edition

15

15

Issues with Naïve Bayes Classifier

Consider the table with Tid = 7 deleted

Tid Refund Marital Taxable Status Evade Income 125K No Yes Sinale 100K 2 Married No No 3 Single 70K No Νo Yes Married 120K No 95K Yes 5 No Divorced 6 Married 60K No Single 85K Yes No 75K No 10 No Single 90K

Naïve Bayes Classifier:

P(Refund = Yes | No) = 2/6
P(Refund = No | No) = 4/6
P(Refund = No | Yes) = 0
P(Refund = No | Yes) = 1
P(Marital Status = Single | No) = 2/6
P(Marital Status = Divorced | No) = 0
P(Marital Status = Married | No) = 4/6
P(Marital Status = Single | Yes) = 2/3
P(Marital Status = Divorced | Yes) = 1/3
P(Marital Status = Divorced | Yes) = 0/3
For Taxable Income:
If class = No: sample mean = 91
sample variance = 685
If class = No: sample mean = 90
sample variance = 25

Given X = (Refund = Yes, Divorced, 120K) P(X | No) = 2/6 X 0 X 0.0083 = 0

 $P(X | Yes) = 0 X 1/3 X 1.2 X 10^{-9} = 0$

Naïve Bayes will not be able to classify X as Yes or No!

2/08/2021

Introduction to Data Mining, 2nd Edition

Issues with Naïve Bayes Classifier

- If one of the conditional probabilities is zero, then the entire expression becomes zero
- Need to use other estimates of conditional probabilities than simple fractions
- · Probability estimation:

original: $P(X_i = c|y) = \frac{n_c}{n}$

Laplace Estimate: $P(X_i = c|y) = \frac{n_c + 1}{n + v}$

 $m - estimate: P(X_i = c|y) = \frac{n_c + mp}{n + m}$

n: number of training instances belonging to class y

 n_c : number of instances with $X_i = c$ and Y = y

v: total number of attribute values that X_i can take

p: initial estimate of $(P(X_i = c|y) \text{ known apriori})$

m: hyper-parameter for our confidence in *p*

Introduction to Data Mining, 2nd Edition

Naïve Bayes (Summary)

- Robust to isolated noise points
- Handle missing values by ignoring the instance during probability estimate calculations
- Robust to irrelevant attributes
- Redundant and correlated attributes will violate class conditional assumption
 - -Use other techniques such as Bayesian Belief Networks (BBN)

2/08/2021

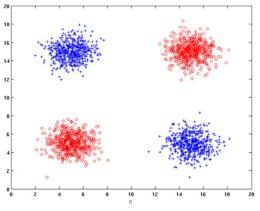

Introduction to Data Mining, 2nd Edition

19

19

Naïve Bayes

· How does Naïve Bayes perform on the following dataset?

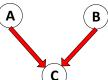

Conditional independence of attributes is violated

2/08/2021

Introduction to Data Mining, 2nd Edition

Bayesian Belief Networks

- Provides graphical representation of probabilistic relationships among a set of random variables
- · Consists of:
 - A directed acyclic graph (dag)
 - Node corresponds to a variable
 - ◆ Arc corresponds to dependence relationship between a pair of variables

A probability table associating each node to its immediate parent
